REMARKS:

This report covers the items of the test cache in on the second recovery. Time lapse was one year and 10 days.

25X1

The stainless steel burial container was in excellent condition. The gasket did not show any visual signs of deterioration and still maintained its flexibility. All items and packaging inside the container were in excellent condition.

The Japanese 5-gallon can is still serving its original purpose of being a container to hold packaged items together and make easier recovery. Although in both the 6-month recovery and this one, there was water and dirt inside the can. All items packaged inside were in very good condition. The Japanese rubber which was included in this test is holding up well, and at present, we have not had a loss.

The bamboo section is not a suitable container for burial. The white ants seem to really enjoy it. The bamboo was used only as a means of keeping packaged items together. The packaged items were in plastic and rubber, and at present, we have not had any losses. The Japanese rubber which was used in the container was beginning to show some age. The inside of the package was still in good shape, and the rubber had retained its elasticity and self-sealing properties.
